

ABSTRACT OF THE INVENTION

The invention is directed to novel indole peptidomimetic compounds which are useful as thrombin receptor antagonists for the treatment of diseases associated with thrombosis, restenosis, hypertension, heart failure, arrhythmia, inflammation, angina, stroke, atherosclerosis, ischemic conditions, Angiogenesis related disorders, cancer, and neurodegenerative disorders. Pharmaceutical compositions comprising the substituted indole peptidomimetics of the present invention and methods of treating conditions mediated by the thrombin receptor are also disclosed.
